COURSE CONTENT

Student Learning Outcomes:

At the conclusion of this course, the student should be able to:

1. Analyze and solve chemical systems using quantitative models.
2. Relate the concepts of chemical equilibrium and free energy.
3. Apply the principles of quantitative analysis in a laboratory setting.
4. Analyze unknown samples using advanced instrumentation.
5. Write comprehensive laboratory reports to effectively analyze data and communicate results and conclusions.

Objectives:

During this course, students will:

1. Solve for the concentrations or pressures of various species in a chemical equilibrium.
2. Apply the concepts of chemical equilibrium to acids and bases, buffers, titration, solubility, electrochemistry and metal complex formation.
3. Determine the free energy change for a physical or chemical process at nonstandard conditions.
4. Apply the principles of electrochemistry in the construction and analysis of voltaic and electrolytic cells.
5. Use kinetics to describe the rate and possible mechanisms of a reaction.
6. Describe isomerism and bonding in transition metal complexes.
7. Describe the kinetics and other phenomena related to nuclear chemistry and radioactivity.
8. Identify and control factors that influence experimental error in gravimetric and volumetric

- analysis.
